In this study, an optimal planning model of MES is established for ADN with a goal of minimising the annual cost of a distribution system.

The energy demand is increasing especially in the urban areas. Various sources of energy are used to fulfill the energy demand. The fossil fuel is depleting and

These aspects are discussed, along with a discussion on the cost-benefit analysis of mobile energy resources. The paper concludes by presenting research gaps, associated challenges, ...

In this paper, a methodology for optimal techno-economic sizing of a DC-microgrid for covering EV mobility needs is carried out. It is based on the definition of different scenarios ...

This study tackles these challenges by optimizing the configurations of Modular Mobile Battery Energy Storage (MMBES) in urban distribution grids, particularly focusing on ...

While enhancing grid reliability and resilience remains a critical objective in MESS/TESS deployment, it is equally important to assess the business use cases and cost ...

This discovery fully confirms the enormous potential and application value of mobile energy storage in high proportion renewable energy scenarios, providing strong ...

Considering the randomness of faults, the scenario analysis method is used to ensure that the configured energy storage system can satisfy the power system's requirements.

The proposed system is comprised of the solar PV, electric vehicle (EV), utility grid and energy storage system. Prosumer Microgrid is analyzed in literature but ignores mobile ...

The proposed method can fully combine the time-space flexibility of MESS and the economic advantages of SESS, which can reduce the total cost and ensure the power ...
