Can low-carbon communication base stations improve local energy use?

Therefore, low-carbon upgrades to communication base stations can effectively improve the economics of local energy use while reducing local environmental pollution and gaining public health benefits. For this research, we recommend further in-depth exploration in three areas for the future.

How effective are communication base stations in reducing air pollution?

In Figure 5 A, after implementing optimization measures to communication base stations, the cases of COPDs related to air pollution caused by communication base stations in 2021 would be reduced to 13,004 (65% reduction). The effectiveness of these optimizations becomes more pronounced in the following year.

Can a low-carbon base station improve public health?

The results of this study indicate that low-carbon upgrades of base stations can not only significantly reduce the operational costs and carbon emissions of communication systems but also reduce pollution and bring considerable public health benefits. However, this transformation still needs to overcome multidimensional challenges.

How does a communication base station upgrade affect emissions?

(D) Total emissions of major pollutants (CO₂, NO_x, SO₂, and PM_{2.5}) generated by the electricity consumption of communication base stations before and after the upgrade. Paired bars with the same color represent pre- and post-upgrade comparisons for the same pollutant. Emissions of all pollutants are significantly reduced after the upgrade.

According to the Memorandum, the environmental impact assessment of the construction of mobile communication base stations should be conducted in the form of an environmental ...

Communication base stations are spread all over the country. Manually managed communication base stations are not only inefficient but also waste a lot of manpower and ...

FET actively engages in communication with stakeholders and has a well-defined stakeholder communication

policy. Upon evaluation, it has been determined that the most critical local ...

These outcomes demonstrate that upgrading to low-carbon base stations not only ensures economic feasibility but also delivers significant environmental and public health ...

Small wireless facilities generally qualify for the categorical exclusion for collocations. In general, collocations are categorically excluded from detailed environmental review under NEPA and ...

The integration of Environmental, Social, and Governance (ESG) principles into the Small Communication Base Station (SCBS) ...

Within this context, the mobile networks in the Information and Communication Technology (ICT) sector are growing and evolving. Specifically, the environmental impacts of the radio access ...

Based on the above background, in order to solve the contradiction between the rapid construction of communication BS and the management of EMR environmental impact ...

The integration of Environmental, Social, and Governance (ESG) principles into the Small Communication Base Station (SCBS) solution market is increasingly shaping ...

Abstract--5G is a high-bandwidth low-latency communication technology that requires deploying new cellular base stations. The environmental cost of deploying a 5G cellular network remains ...

In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for ...
