Are green cellular base stations sustainable?

This study presents an overview of sustainable and green cellular base stations (BSs), which account for most of the energy consumed in cellular networks. We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the past decade.

How do cellular network operators shift to green practices?

Cellular network operators attempt to shift toward green practices using two main approaches. The first approach uses energy-efficient hardware to reduce the energy consumption of BSs at the equipment level and adopts economic power sources to feed these stations.

Can Green meter reduce net energy consumption in communications networks?

GreenTouch green meter research study: Reducing the net energy consumption in communications networks by up to 90% by (2020). A GreenTouch White Paper, no. Version, 1. Atiyah Abd, A., Sieh Kiong, T., Koh, J., Chieng, D., & Ting, A. (2012). Energy efficiency of heterogeneous cellular networks: A review.

How can mobile network architecture contribute to green networking?

The representation of the mobile network architecture along with the expanded view of the 5G base station has been depicted in Fig. 5. Improving hardware components can contribute toward green networking. It entails reducing BS's energy consumption by using energy-efficient hardware.

The main goal of designing green base stations is to save energy and reduce power consumption while guaranteeing user service and coverage and ensuring the base station's capability for ...

The green base station solution involves base station system architecture, base station form, power saving technologies, and application of green technologies. Using SDR-based ...

For base stations the 3GPP specification TS 38.141 covers transmitter and receiver characteristics of base stations as well as receiver performance under noise and fading ...

In this article, a robust RL-based multicells sleeping model called graph deep deterministic policy gradient (GDDPG) is developed for handling highly complex communication scenarios. ...

To further explore the energy-saving potential of 5 G base stations, this paper proposes an energy-saving operation model for 5 G base stations that incorporates ...

We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the past decade.

However, the design of a green mobile network requires the dimensioning of the energy harvesting and storage systems through the estimation of the network's energy ...

Our approach is to reduce the intake of power by the base stations during unwanted time. This can be done by establishing communication between the adjacent towers to intimate the ...

Section 3 elaborates on the EE problem of 5G base stations, its metrics along with parameters affecting it. Section 4 discusses the green cellular network approaches along with their critical ...

Based on ZigBee technology, a real-time monitoring system for the base station environment is designed in this paper, which enables the operation and maintenance personnel to remotely ...
