Why is inverter efficiency important?

By approximation, efficiency of the inverter is a linear factor for the system's energy yield. Consequently, for a good system performance, a high efficiency over the entire power range is essential. Notably, the inverter efficiency also depends on the DC voltage.

Which type of inverter has the best efficiency?

The type 1 inverter presents a lower efficiency for small load (<30%), type 2 has the best efficiency whatever the percentage of load. Finally, the efficiency in type 3 decreases for high percentage of load in a more important way than for the two other types. 2017, The Performance of Photovoltaic (PV) System N.M. Pearsall

Why does inverter efficiency decrease with a small rate?

It is important to note that the inverter efficiency declines with a small rate after peaking with incident energy levels around 400-700 W/m² due to the temperature increase inside the inverter when it handles loads with more power.
